

Features

- High-performance, Low-power Atmel®AVR®8-bit Microcontroller
- Advanced RISC Architecture
 - 133 Powerful Instructions – Most Single Clock Cycle Execution
 - 32 x 8 General Purpose Working Registers + Peripheral Control Registers
 - Fully Static Operation
 - Up to 16MIPS Throughput at 16MHz
 - On-chip 2-cycle Multiplier
- High Endurance Non-volatile Memory segments
 - 128Kbytes of In-System Self-programmable Flash program memory
 - 4Kbytes EEPROM
 - 4Kbytes Internal SRAM
 - Write/Erase cycles: 10,000 Flash/100,000 EEPROM
 - Data retention: 20 years at 85°C/100 years at 25°C⁽¹⁾
 - Optional Boot Code Section with Independent Lock Bits
 - In-System Programming by On-chip Boot Program
 - True Read-While-Write Operation
 - Up to 64Kbytes Optional External Memory Space
 - Programming Lock for Software Security
 - SPI Interface for In-System Programming
- JTAG (IEEE std. 1149.1 Compliant) Interface
 - Boundary-scan Capabilities According to the JTAG Standard
 - Extensive On-chip Debug Support
 - Programming of Flash, EEPROM, Fuses and Lock Bits through the JTAG Interface
- Peripheral Features
 - Two 8-bit Timer/Counters with Separate Prescalers and Compare Modes
 - Two Expanded 16-bit Timer/Counters with Separate Prescaler, Compare Mode and Capture Mode
 - Real Time Counter with Separate Oscillator
 - Two 8-bit PWM Channels
 - 6 PWM Channels with Programmable Resolution from 2 to 16 Bits
 - Output Compare Modulator
 - 8-channel, 10-bit ADC
 - 8 Single-ended Channels
 - 7 Differential Channels
 - 2 Differential Channels with Programmable Gain at 1x, 10x, or 200x
 - Byte-oriented Two-wire Serial Interface
 - Dual Programmable Serial USARTs
 - Master/Slave SPI Serial Interface
 - Programmable Watchdog Timer with On-chip Oscillator
 - On-chip Analog Comparator
- Special Microcontroller Features
 - Power-on Reset and Programmable Brown-out Detection
 - Internal Calibrated RC Oscillator
 - External and Internal Interrupt Sources
 - Six Sleep Modes: Idle, ADC Noise Reduction, Power-save, Power-down, Standby, and Extended Standby
 - Software Selectable Clock Frequency
 - ATmega103 Compatibility Mode Selected by a Fuse
 - Global Pull-up Disable
- I/O and Packages
 - 53 Programmable I/O Lines
 - 64-lead TQFP and 64-pad QFN/MLF
- Operating Voltages
 - 2.7 - 5.5V ATmega128L
 - 4.5 - 5.5V ATmega128
- Speed Grades
 - 0 - 8MHz ATmega128L
 - 0 - 16MHz ATmega128

Overview

The Atmel® AVR® ATmega128 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the ATmega128 achieves throughputs approaching 1MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

Block Diagram

Figure 2. Block Diagram

The Atmel® AVR® core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The ATmega128 provides the following features: 128Kbytes of In-System Programmable Flash with Read-While-Write capabilities, 4Kbytes EEPROM, 4Kbytes SRAM, 53 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), four flexible Timer/Counters with compare modes and PWM, 2 USARTs, a byte oriented Two-wire Serial Interface, an 8-channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a timer base while the rest of the device is sleeping. The ADC Noise Reduction mode stops the CPU and all I/O modules except Asynchronous Timer and ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption. In Extended Standby mode, both the main Oscillator and the Asynchronous Timer continue to run.

The device is manufactured using Atmel's high-density nonvolatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the Atmel ATmega128 is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega128 device is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

ATmega103 and ATmega128 Compatibility

The ATmega128 is a highly complex microcontroller where the number of I/O locations supersedes the 64 I/O locations reserved in the AVR instruction set. To ensure backward compatibility with the ATmega103, all I/O locations present in ATmega103 have the same location in ATmega128. Most additional I/O locations are added in an Extended I/O space starting from \$60 to \$FF, (i.e., in the ATmega103 internal RAM space). These locations can be reached by using LD/LDS/LDD and ST/STS/STD instructions only, not by using IN and OUT instructions. The relocation of the internal RAM space may still be a problem for ATmega103 users. Also, the increased number of interrupt vectors might be a problem if the code uses absolute addresses. To solve these problems, an ATmega103 compatibility mode can be selected by programming the fuse M103C. In this mode, none of the functions in the Extended I/O space are in use, so the internal RAM is located as in ATmega103. Also, the Extended Interrupt vectors are removed.

The ATmega128 is 100% pin compatible with ATmega103, and can replace the ATmega103 on current Printed Circuit Boards. The application note "Replacing ATmega103 by ATmega128" describes what the user should be aware of replacing the ATmega103 by an ATmega128.

ATmega103 Compatibility Mode

By programming the M103C fuse, the Atmel®ATmega128 will be compatible with the ATmega103 regards to RAM, I/O pins and interrupt vectors as described above. However, some new features in ATmega128 are not available in this compatibility mode, these features are listed below:

- One USART instead of two, Asynchronous mode only. Only the eight least significant bits of the Baud Rate Register is available.
- One 16-bit Timer/Counter with two compare registers instead of two 16-bit Timer/Counters with three compare registers.
- Two-wire serial interface is not supported.
- Port C is output only.
- Port G serves alternate functions only (not a general I/O port).
- Port F serves as digital input only in addition to analog input to the ADC.
- Boot Loader capabilities is not supported.
- It is not possible to adjust the frequency of the internal calibrated RC Oscillator.
- The External Memory Interface can not release any Address pins for general I/O, neither configure different wait-states to different External Memory Address sections.

In addition, there are some other minor differences to make it more compatible to ATmega103:

- Only EXTRF and PORF exists in MCUCSR.
- Timed sequence not required for Watchdog Time-out change.
- External Interrupt pins 3 - 0 serve as level interrupt only.
- USART has no FIFO buffer, so data overrun comes earlier.

Unused I/O bits in ATmega103 should be written to 0 to ensure same operation in ATmega128.

Pin Descriptions

VCC Digital supply voltage.

GND Ground.

Port A (PA7..PA0) Port A is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port A also serves the functions of various special features of the ATmega128 as listed on [page 72](#).

Port B (PB7..PB0) Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B also serves the functions of various special features of the ATmega128 as listed on [page 73](#).

Port C (PC7..PC0) Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up

resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port C also serves the functions of special features of the Atmel® AVR®ATmega128 as listed on [page 76](#). In ATmega103 compatibility mode, Port C is output only, and the port C pins are not tri-stated when a reset condition becomes active.

Note: The ATmega128 is by default shipped in ATmega103 compatibility mode. Thus, if the parts are not programmed before they are put on the PCB, PORTC will be output during first power up, and until the ATmega103 compatibility mode is disabled.

Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega128 as listed on [page 77](#).

Port E (PE7..PE0)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port E also serves the functions of various special features of the ATmega128 as listed on [page 80](#).

Port F (PF7..PF0)

Port F serves as the analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter is not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a Reset occurs.

The TDO pin is tri-stated unless TAP states that shift out data are entered.

Port F also serves the functions of the JTAG interface.

In ATmega103 compatibility mode, Port F is an input Port only.

Port G (PG4..PG0)

Port G is a 5-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port G output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port G pins that are externally pulled low will source current if the pull-up resistors are activated. The Port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port G also serves the functions of various special features.

The port G pins are tri-stated when a reset condition becomes active, even if the clock is not running.

In ATmega103 compatibility mode, these pins only serves as strobes signals to the external memory as well as input to the 32kHz Oscillator, and the pins are initialized to PG0 = 1, PG1 = 1, and PG2 = 0 asynchronously when a reset condition becomes active, even if the clock is not running. PG3 and PG4 are oscillator pins.

<u>RESET</u>	Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in Table 19 on page 50 . Shorter pulses are not guaranteed to generate a reset.
XTAL1	Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.
XTAL2	Output from the inverting Oscillator amplifier.
AVCC	AVCC is the supply voltage pin for Port F and the A/D Converter. It should be externally connected to V_{CC} , even if the ADC is not used. If the ADC is used, it should be connected to V_{CC} through a low-pass filter.
AREF	AREF is the analog reference pin for the A/D Converter.
PEN	PEN is a programming enable pin for the SPI Serial Programming mode, and is internally pulled high. By holding this pin low during a Power-on Reset, the device will enter the SPI Serial Programming mode. <u>PEN</u> has no function during normal operation.

- Notes:
1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
 2. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers \$00 to \$1F only.

Errata

The revision letter in this section refers to the revision of the ATmega128 device.

ATmega128 Rev. F to M

- **First Analog Comparator conversion may be delayed**
- **Interrupts may be lost when writing the timer registers in the asynchronous timer**
- **Stabilizing time needed when changing XDIV Register**
- **Stabilizing time needed when changing OSCCAL Register**
- **IDCODE masks data from TDI input**
- **Reading EEPROM by using ST or STS to set EERE bit triggers unexpected interrupt request**

1. **First Analog Comparator conversion may be delayed**

If the device is powered by a slow rising V_{CC} , the first Analog Comparator conversion will take longer than expected on some devices.

Problem Fix/Workaround

When the device has been powered or reset, disable then enable the Analog Comparator before the first conversion.

2. **Interrupts may be lost when writing the timer registers in the asynchronous timer**

The interrupt will be lost if a timer register that is synchronous timer clock is written when the asynchronous Timer/Counter register (TCNTx) is 0x00.

Problem Fix/Workaround

Always check that the asynchronous Timer/Counter register neither have the value 0xFF nor 0x00 before writing to the asynchronous Timer Control Register (TCCRx), asynchronous Timer Counter Register (TCNTx), or asynchronous Output Compare Register (OCRx).

3. **Stabilizing time needed when changing XDIV Register**

After increasing the source clock frequency more than 2% with settings in the XDIV register, the device may execute some of the subsequent instructions incorrectly.

Problem Fix / Workaround

The NOP instruction will always be executed correctly also right after a frequency change. Thus, the next 8 instructions after the change should be NOP instructions. To ensure this, follow this procedure:

1. Clear the I bit in the SREG Register.
2. Set the new pre-scaling factor in XDIV register.
3. Execute 8 NOP instructions
4. Set the I bit in SREG

This will ensure that all subsequent instructions will execute correctly.

Assembly Code Example:

```

CLI                ; clear global interrupt enable
OUT  XDIV, temp    ; set new prescale value
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation
NOP                ; no operation

```

```
SEI          ; set global interrupt enable
```

4. Stabilizing time needed when changing OSCCAL Register

After increasing the source clock frequency more than 2% with settings in the OSCCAL register, the device may execute some of the subsequent instructions incorrectly.

Problem Fix / Workaround

The behavior follows errata number 3., and the same Fix / Workaround is applicable on this errata.

5. IDCODE masks data from TDI input

The JTAG instruction IDCODE is not working correctly. Data to succeeding devices are replaced by all-ones during Update-DR.

Problem Fix / Workaround

- If ATmega128 is the only device in the scan chain, the problem is not visible.
- Select the Device ID Register of the ATmega128 by issuing the IDCODE instruction or by entering the Test-Logic-Reset state of the TAP controller to read out the contents of its Device ID Register and possibly data from succeeding devices of the scan chain. Issue the BYPASS instruction to the ATmega128 while reading the Device ID Registers of preceding devices of the boundary scan chain.
- If the Device IDs of all devices in the boundary scan chain must be captured simultaneously, the ATmega128 must be the first device in the chain.

6. Reading EEPROM by using ST or STS to set EERE bit triggers unexpected interrupt request.

Reading EEPROM by using the ST or STS command to set the EERE bit in the EECR register triggers an unexpected EEPROM interrupt request.

Problem Fix / Workaround

Always use OUT or SBI to set EERE in EECR.

Datasheet Revision History

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

- Rev. 2467V-02/11**
1. Updated the literature number (2467) that accidentally changed in rev U.
 2. Editing update according to the Atmel new style guide. No more space between the numbers and their units.
 3. Reorganized the swapped chapters in rev U: 8-bit Timer/Counter 0, 16-bit TC1 and TC3, and 8-bit TC2 with PWM.
- Rev. 2467U-08/10**
1. Updated [“Ordering Information” on page 15](#). Added Ordering information for Appendix A ATmega128/L 105°C.
- Rev. 2467T-07/10**
1. Updated the [“USARTn Control and Status Register B – UCSRnB” on page 189](#).
 2. Added a link from [“Minimizing Power Consumption” on page 47](#) to [“System Clock and Clock Options” on page 35](#).
 3. Updated use of Technical Terminology in datasheet
 4. Corrected formula in [Table 133, “Two-wire Serial Bus Requirements,” on page 322](#)
 5. Note 6 and Note 7 below [Table 133, “Two-wire Serial Bus Requirements,” on page 322](#) have been removed
- Rev. 2467S-07/09**
1. Updated the [“Errata” on page 18](#).
 2. Updated the TOC with the newest template (version 5.10).
 3. Added note [“Not recommended from new designs“](#) from the front page.
 4. Added typical I_{CC} values for Active and Idle mode in [“DC Characteristics” on page 318](#).
- Rev. 2467R-06/08**
1. Removed [“Not recommended from new designs“](#) from the front page.
- Rev. 2467Q-05/08**
1. Updated [“Preventing EEPROM Corruption” on page 24](#).
Removed sentence “If the detection level of the internal BOD does not match the needed detection level, and external low V_{CC} Reset Protection circuit can be used.”
 2. Updated [Table 85 on page 196](#) in [“Examples of Baud Rate Setting” on page 193](#).
Removed examples of frequencies above 16MHz.
 3. Updated [Figure 114 on page 238](#).
Inductor value corrected from 10mH to 10 μ H.
 4. Updated description of [“Version” on page 253](#).

5. ATmega128L removed from “DC Characteristics” on page 318.
6. Added “Speed Grades” on page 320.
7. Updated “Ordering Information” on page 15.
Pb-Plated packages are no longer offered, and the ordering information for these packages are removed.
There will no longer exist separate ordering codes for commercial operation range, only industrial operation range.
8. Updated “Errata” on page 18:
Merged errata description for rev.F to rev.M in “ATmega128 Rev. F to M”.

Rev. 2467P-08/07

1. Updated “Features” on page 1.
2. Added “Data Retention” on page 8.
3. Updated Table 60 on page 133 and Table 95 on page 235.
4. Updated “C Code Example⁽¹⁾” on page 176.
5. Updated Figure 114 on page 238.
6. Updated “XTAL Divide Control Register – XDIV” on page 36.
7. Updated “Errata” on page 18.
8. Updated Table 34 on page 76.
9. Updated “Slave Mode” on page 166.

Rev. 2467O-10/06

1. Added note to “Timer/Counter Oscillator” on page 43.
2. Updated “Fast PWM Mode” on page 124.
3. Updated Table 52 on page 104, Table 54 on page 104, Table 59 on page 133, Table 61 on page 134, Table 64 on page 156, and Table 66 on page 157.
4. Updated “Errata” on page 18.

Rev. 2467N-03/06

1. Updated note for Figure 1 on page 2.
2. Updated “Alternate Functions of Port D” on page 77.
3. Updated “Alternate Functions of Port G” on page 84.
4. Updated “Phase Correct PWM Mode” on page 100.
5. Updated Table 59 on page 133, Table 60 on page 133.
6. Updated “Bit 2 – TOV3: Timer/Counter3, Overflow Flag” on page 141.

7. Updated “Serial Peripheral Interface – SPI” on page 162.
8. Updated Features in “Analog to Digital Converter” on page 230
9. Added note in “Input Channel and Gain Selections” on page 243.
10. Updated “Errata” on page 18.

Rev. 2467M-11/04

1. Removed “analog ground”, replaced by “ground”.
2. Updated Table 11 on page 40, Table 114 on page 285, Table 128 on page 303, and Table 132 on page 321. Updated Figure 114 on page 238.
3. Added note to “Port C (PC7..PC0)” on page 5.
4. Updated “Ordering Information” on page 15.

Rev. 2467L-05/04

1. Removed “Preliminary” and “TBD” from the datasheet, replaced occurrences of ICx with ICPx.
2. Updated Table 8 on page 38, Table 19 on page 50, Table 22 on page 56, Table 96 on page 242, Table 126 on page 299, Table 128 on page 303, Table 132 on page 321, and Table 134 on page 323.
3. Updated “External Memory Interface” on page 25.
4. Updated “Device Identification Register” on page 253.
5. Updated “Electrical Characteristics” on page 318.
6. Updated “ADC Characteristics” on page 325.
7. Updated “Typical Characteristics” on page 333.
8. Updated “Ordering Information” on page 15.

Rev. 2467K-03/04

1. Updated “Errata” on page 18.

Rev. 2467J-12/03

1. Updated “Calibrated Internal RC Oscillator” on page 41.

Rev. 2467I-09/03

1. Updated note in “XTAL Divide Control Register – XDIV” on page 36.
2. Updated “JTAG Interface and On-chip Debug System” on page 48.
3. Updated values for V_{BOT} (BODLEVEL = 1) in Table 19 on page 50.
4. Updated “Test Access Port – TAP” on page 246 regarding JTAGEN.
5. Updated description for the JTD bit on page 255.
6. Added a note regarding JTAGEN fuse to Table 118 on page 288.

7. Updated R_{PU} values in [“DC Characteristics” on page 318](#).
8. Added a proposal for solving problems regarding the JTAG instruction IDCODE in [“Errata” on page 18](#).

Rev. 2467H-02/03

1. Corrected the names of the two Prescaler bits in the SFIOR Register.
2. Added Chip Erase as a first step under [“Programming the Flash” on page 315](#) and [“Programming the EEPROM” on page 316](#).
3. Removed reference to the [“Multipurpose Oscillator”](#) application note and the [“32kHz Crystal Oscillator”](#) application note, which do not exist.
4. Corrected OCn waveforms in [Figure 52 on page 125](#).
5. Various minor Timer1 corrections.
6. Added information about PWM symmetry for Timer0 and Timer2.
7. Various minor TWI corrections.
8. Added reference to [Table 124 on page 291](#) from both SPI Serial Programming and Self Programming to inform about the Flash Page size.
9. Added note under [“Filling the Temporary Buffer \(Page Loading\)” on page 280](#) about writing to the EEPROM during an SPM Page load.
10. Removed ADHSM completely.
11. Added section [“EEPROM Write During Power-down Sleep Mode” on page 24](#).
12. Updated drawings in [“Packaging Information” on page 16](#).

Rev. 2467G-09/02

1. Changed the Endurance on the Flash to 10,000 Write/Erase Cycles.

Rev. 2467F-09/02

1. Added 64-pad QFN/MLF Package and updated [“Ordering Information” on page 15](#).
2. Added the section [“Using all Locations of External Memory Smaller than 64 Kbyte” on page 32](#).
3. Added the section [“Default Clock Source” on page 37](#).
4. Renamed SPMCR to SPMCSR in entire document.
5. When using external clock there are some limitations regards to change of frequency. This is descried in [“External Clock” on page 42](#) and [Table 131, “External Clock Drive,” on page 320](#).
6. Added a sub section regarding OCD-system and power consumption in the section [“Minimizing Power Consumption” on page 47](#).
7. Corrected typo (WGM-bit setting) for:
[“Fast PWM Mode” on page 98](#) (Timer/Counter0).

“Phase Correct PWM Mode” on page 100 (Timer/Counter0).

“Fast PWM Mode” on page 151 (Timer/Counter2).

“Phase Correct PWM Mode” on page 152 (Timer/Counter2).

8. Corrected [Table 81 on page 191 \(USART\)](#).
9. Corrected [Table 102 on page 259 \(Boundary-Scan\)](#)
10. Updated V_{IL} parameter in [“DC Characteristics” on page 318](#).

Rev. 2467E-04/02

1. Updated the Characterization Data in Section [“Typical Characteristics” on page 333](#).
2. Updated the following tables:
[Table 19 on page 50](#), [Table 20 on page 54](#), [Table 68 on page 157](#), [Table 102 on page 259](#), and [Table 136 on page 328](#).
3. Updated Description of OSCCAL Calibration Byte.
In the data sheet, it was not explained how to take advantage of the calibration bytes for 2MHz, 4MHz, and 8MHz Oscillator selections. This is now added in the following sections:
Improved description of [“Oscillator Calibration Register – OSCCAL” on page 41](#) and [“Calibration Byte” on page 289](#).

Rev. 2467D-03/02

1. Added more information about [“ATmega103 Compatibility Mode” on page 5](#).
2. Updated [Table 2, “EEPROM Programming Time,” on page 22](#).
3. Updated typical Start-up Time in [Table 7 on page 37](#), [Table 9](#) and [Table 10 on page 39](#), [Table 12 on page 40](#), [Table 14 on page 41](#), and [Table 16 on page 42](#).
4. Updated [Table 22 on page 56](#) with typical WDT Time-out.
5. Corrected description of ADSC bit in [“ADC Control and Status Register A – ADCSRA” on page 244](#).
6. Improved description on how to do a polarity check of the ADC differential results in [“ADC Conversion Result” on page 241](#).
7. Corrected JTAG version numbers in [“JTAG Version Numbers” on page 256](#).
8. Improved description of addressing during SPM (usage of RAMPZ) on [“Addressing the Flash During Self-Programming” on page 278](#), [“Performing Page Erase by SPM” on page 280](#), and [“Performing a Page Write” on page 280](#).
9. Added note regarding OCDEN Fuse below [Table 118 on page 288](#).
10. Updated Programming Figures:
[Figure 135 on page 290](#) and [Figure 144 on page 301](#) are updated to also reflect that AVCC must be connected during Programming mode. [Figure 139 on page 297](#) added to illustrate how to program the fuses.
11. Added a note regarding usage of the PROG_PAGELOAD and PROG_PAGEREAD instructions on [page 307](#).

12. **Added Calibrated RC Oscillator characterization curves in section “Typical Characteristics” on page 333.**
13. **Updated “Two-wire Serial Interface” section.**
More details regarding use of the TWI Power-down operation and using the TWI as master with low TWBRR values are added into the data sheet. Added the note at the end of the “Bit Rate Generator Unit” on page 203. Added the description at the end of “Address Match Unit” on page 204.
14. **Added a note regarding usage of Timer/Counter0 combined with the clock. See “XTAL Divide Control Register – XDIV” on page 36.**

Rev. 2467C-02/02

1. **Corrected Description of Alternate Functions of Port G**
Corrected description of TOSC1 and TOSC2 in “Alternate Functions of Port G” on page 84.
2. **Added JTAG Version Numbers for rev. F and rev. G**
Updated Table 100 on page 256.
3. **Added Some Preliminary Test Limits and Characterization Data**
Removed some of the TBD's in the following tables and pages:
Table 19 on page 50, Table 20 on page 54, “DC Characteristics” on page 318, Table 131 on page 320, Table 134 on page 323, and Table 136 on page 328.
4. **Corrected “Ordering Information” on page 15.**
5. **Added some Characterization Data in Section “Typical Characteristics” on page 333..**
6. **Removed Alternative Algorithm for Leaving JTAG Programming Mode.**
See “Leaving Programming Mode” on page 315.
7. **Added Description on How to Access the Extended Fuse Byte Through JTAG Programming Mode.**
See “Programming the Fuses” on page 317 and “Reading the Fuses and Lock Bits” on page 317.
